According to our (Global Info Research) latest study, the global Pressure Reducing Valve with Solenoid Control market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A pressure-reducing valve with solenoid control is a type of valve used in fluid control systems to regulate and maintain a specific pressure level in a pipeline or system. The valve is equipped with a solenoid, an electrically operated device that controls the opening and closing of the valve. The pressure-reducing valve portion of the assembly is responsible for reducing the incoming pressure to a desired lower pressure level. It ensures that the downstream pressure remains constant, regardless of any fluctuations in the upstream pressure. This is achieved by automatically adjusting the valve opening to limit the flow rate and maintain the set pressure. The solenoid control component is responsible for actuating the valve. It uses an electromagnetic coil to control the movement of a plunger or disc within the valve body. When an electric current is applied to the solenoid, it generates a magnetic field that pulls or releases the plunger, opening or closing the valve accordingly. The solenoid control enables remote or automated control of the pressure-reducing valve. It can be integrated into a larger control system or operated manually using electrical signals. This allows for precise and efficient control of the pressure in the pipeline, making it suitable for applications where maintaining a specific pressure level is critical, such as in water distribution networks, industrial processes, or HVAC systems.
