A pressure release valve is a safety device that automatically opens to release pressure when the pressure in a system or container exceeds a predetermined safety value, preventing the system or container from being damaged or causing an accident due to overpressure. It reduces the pressure in the system by discharging part of the fluid, thereby protecting the safety of equipment and personnel. A sustaining valve is a valve used to control the flow of media during system maintenance or overhaul. It can be opened or closed when necessary to maintain the system at a safe pressure level, or to keep the system pressure stable under certain conditions.
