Pressure vessels dished ends, also known as heads or tank heads, are critical components used in the design and construction of pressure vessels, which are containers designed to hold gases or liquids at a pressure substantially different from the ambient pressure. These ends are typically welded to the cylindrical body of the pressure vessel to close off the ends, ensuring the vessel can safely withstand the internal pressure. Dished ends come in various shapes, including hemispherical, ellipsoidal, torispherical, and flat, each offering different characteristics in terms of stress distribution, manufacturing cost, and capacity. The choice of dished end shape depends on factors like the intended pressure load, material properties, and application requirements. Proper selection and fabrication of dished ends are crucial for the structural integrity and safety of pressure vessels in industries such as chemical processing, oil and gas, and power generation.
