Key upstream suppliers include Jiangsu Longteng Special Steel and Anhui Conch Cement.

Major downstream customers include Power Construction Corporation of China and China Railway.

Prestressed Spun High Strength Concrete Pile is a type of concrete pile whose load-bearing capacity is enhanced through prestressing during the manufacturing process. Its core principle is to stretch and fix high-strength reinforcing bars or steel strands before concrete pouring and curing. After the concrete reaches the designed strength, the tension in the steel reinforcement is released, thereby generating compressive stress within the concrete. This prestressing effectively counteracts the tensile stress caused by vertical loads and lateral soil pressure, giving the pile higher bending

resistance and crack resistance.

Compared with ordinary reinforced concrete pipe piles, Prestressed Spun High Strength Concrete Pile offers higher bearing capacity, greater rigidity, and superior durability. It is widely used in engineering applications requiring heavy loads and long service life, such as deep foundations, bridges, port terminals, and high-rise buildings. In addition, these piles are typically manufactured in cylindrical or polygonal tubular forms, with customizable lengths and diameters according to design requirements, providing advantages in standardization and industrialized production, transportation, and construction.
