The primary frequency regulation system is an automatic control process. When the frequency of the power grid deviates from the rated value, the control system of the units in the power grid will automatically control the increase or decrease of the active power of the units to limit the change of the grid frequency and maintain the stability of the grid frequency. This control process is dynamic and aims to ensure the balance of the grid's active power to maintain the stable operation of the grid. The realization of primary frequency regulation system mainly depends on the units in the power grid, including thermal power units, hydropower units, and some wind power, photovoltaic, energy storage, etc. This report studies primary frequency regulation systems used in new energy sources such as photovoltaics and wind power.
