Abstracts

The global Primary Myelofibrosis Drug market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Primary myelofibrosis (MF) is a chronic blood cancer in which excessive scar tissue forms in the bone marrow and impairs its ability to produce normal blood cells. Researchers believe MF may be caused by abnormal blood stem cells in the bone marrow. The abnormal stem cells produce mature cells that grow quickly and take over the bone marrow, causing both fibrosis (scar tissue formation) and chronic inflammation.

This report studies the global Primary Myelofibrosis Drug production, demand, key manufacturers, and key regions.
