## Abstracts

According to our (Global Info Research) latest study, the global Primer and Probe Design Services market size was valued at US\$ 144 million in 2025 and is forecast to a readjusted size of US\$ 204 million by 2032 with a CAGR of 5.0% during review period.

Primer and Probe Design Services refer to professional technical services that tailor-specific oligonucleotide primers and probes for nucleic acid detection/analysis experiments (e.g., PCR, qPCR, digital PCR, NGS) based on target nucleic acid sequences (DNA/RNA), experimental purposes, and platform requirements. These services prioritize design parameters such as target specificity, binding affinity, amplification efficiency, and cross-reactivity avoidance, leveraging bioinformatics tools and sequence databases to ensure the designed primers/probes meet experimental sensitivity, reproducibility, and accuracy needs in molecular biology research and clinical testing.

Driven by the booming development of precision medicine, infectious disease prevention, and agricultural biotechnology, the industry is witnessing trends including growing demand for high-specificity, multi-target design, integration of AI/machine learning to optimize design algorithms (reducing trial-and-error costs), and expansion into emerging fields like liquid biopsy and single-cell analysis; key opportunities lie in the rapid response to new pathogens (e.g., emerging viruses), personalized cancer diagnosis, and application in gene editing validation and environmental microbial monitoring; however, challenges persist, such as design difficulties for complex genomic regions (e.g., high GC content, repetitive sequences), compatibility requirements across diverse experimental platforms, and the need to balance specificity with cost-effectiveness, as well as issues related to intellectual property of proprietary design

algorithms and standardization of design criteria.
