## Abstracts

The global Print on Demand (POD) market size is expected to reach \$ 11132 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032). Print-on-demand (POD) is a modern production model based on digital workflows and automated printing systems. Its core lies in abandoning the traditional 'print first, sell later' model of large-scale inventory, instead producing and delivering 'single pieces or small batches' based on actual orders. The production process begins with digitized documents, using high-speed digital printers and automated cutting and binding equipment to achieve integrated and rapid output from data to finished products. The essence of POD is to bridge 'personalized, fragmented needs' with 'mass manufacturing capabilities.' Its greatest advantage lies in achieving true 'zero inventory,' significantly reducing warehousing costs and product obsolescence risks, and enabling extremely low minimum order quantities, highly customized content, and rapid iteration updates. It has become a core technological solution for publishing, commercial printing, personalized marketing materials, and customized textiles.

The market prospects for POD are highly aligned with three major trends: consumer personalization, supply chain agility, and sustainable development. Short-term drivers include the deepening development of global e-commerce, leading to a surge in demand from consumers and brands for small-batch, fast-delivery customized goods, especially in personalized publishing, customized apparel, and home decor. Mid-term development will revolve around 'technology integration' and 'service enhancement': On the one hand, printing quality, speed, and the range of printing materials will continue to break through, and will be combined with technologies such as AI design tools and 3D printing to expand product boundaries; on the other hand, the service model will upgrade from simple manufacturing outsourcing to a one-stop solution integrating front-end design platforms, intelligent warehousing, and global logistics. In the long term, the 'destocking' and 'precision production' model represented by POD will become an

important component in a wider range of manufacturing industries, powerfully promoting the circular economy. Despite challenges such as high initial equipment investment and lower unit costs compared to traditional mass printing, its enormous potential in responding to market fluctuations, reducing resource waste, and unleashing the creative economy will drive it from a niche market to a mainstream production method.
