Abstracts

According to our (Global Info Research) latest study, the global Printed Electronics Devices market size was valued at USD 2870.8 million in 2023 and is forecast to a readjusted size of USD 6144.5 million by 2030 with a CAGR of 11.5% during review period.

Printed electronics is a set of printing methods, which is used to create electrical devices on different substrates such as plastic, ceramic, and textiles. Printed electronics refers to the combination of conductive materials as well as varnish and ink systems, transferred in multiple layers to large areas of film, paper or other substrates at low cost. They perform functions of conventional electronics with special processing possibilities. The report counts printed electronic products manufactured by printing, excluding organic electronic and flexible electronic products.

The biggest features and advantages of printed electronic products are large area, flexibility and low cost, which is in sharp contrast with silicon-based microelectronic products. The equipment investment required for printing electronic devices is extremely low, and printed electronic devices can be made on any substrate material. Although the performance of printed electronic devices is not as good as silicon-based microelectronic devices, the cost advantages and the large area and flexible characteristics make printed electronic technology still have a large number of application fields that silicon-based microelectronic devices cannot.
