According to our (Global Info Research) latest study, the global Privacy Preserving Computing (PPC) Technology market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Privacy Preserving Computing (PPC) technology refers to a set of techniques and tools that aim to protect the privacy of sensitive data while still enabling data processing and analysis. PPC focuses on ensuring that data remains private and confidential throughout various stages, including storage, processing, and sharing.

The goal of PPC is to allow parties to collaborate and perform computations on sensitive data without compromising individual privacy. It addresses the challenge of leveraging data for analysis and deriving insights while preserving confidentiality, particularly in scenarios where data owners are reluctant to share their data due to privacy concerns.

In the digital era, one of the largest challenges is ensuring the security of data while allowing data to flow freely between computing entities. As a result, privacy-preserving computation is gaining traction as a viable solution to this challenge. For a long time, the application of privacy-preserving computation has been limited to a narrow scope of small-scale computation due to performance bottlenecks, lack of confidence in the technology, and standardization issues. However, as more and more integrated technologies, such as dedicated chips, cryptographic algorithms, whitebox implementation, and data trusts, are emerging, privacy-preserving computation will be adopted in scenarios such as processing massive amounts of data and integrating data

from all domains, which is the headway made from processing small amounts of data and data from private domains. The adoption will boost new productivity that is powered by data from all domains. In the next 3 years, we will witness groundbreaking improvements in the performance and interpretability of privacy-preserving computation, and witness the emergence of data trust entities that provide data sharing services based on the technology.
