A Product Carbon Footprint Calculation Application is a software tool designed to quantify and manage greenhouse gas emissions associated with a product throughout its entire life cycle. These applications typically rely on Life Cycle Assessment (LCA) methodologies and follow international standards such as ISO 14067 and the GHG Protocol to evaluate emissions from raw material extraction, manufacturing, transportation, product use, and end-of-life stages. The software helps companies identify carbon hotspots and optimize product design and supply chains. Such applications are commonly delivered as cloud-based platforms or enterprise software integrated with ERP systems, supply chain data, and emission factor databases.

The upstream of the product carbon footprint calculation application industry mainly includes providers of emission factor databases, life cycle assessment (LCA) datasets, cloud computing infrastructure, and environmental standard organizations that define calculation methodologies. The midstream consists of software developers and platform providers that build PCF calculation engines, data management platforms, and enterprise integration solutions. Downstream users mainly include manufacturing companies, consumer goods producers, energy and chemical companies, as well as consulting and certification organizations that use these applications for product carbon accounting, regulatory reporting, and supply chain carbon management.
