A Product Rejection Device is a mechanism or system integrated into a production line or manufacturing process that automatically identifies and removes defective or non-conforming products. These devices use sensors, cameras, or other inspection tools to detect flaws such as incorrect dimensions, missing components, or deviations from quality standards. Once a defect is identified, the device triggers an action—such as diverting the faulty item to a reject bin—ensuring that only products meeting quality criteria proceed to the next stage of production or reach the customer. This helps maintain product quality and reduce waste or customer dissatisfaction.
