The global Program-Controlled Rotational Viscometer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The program-controlled rotational viscometer is an instrument used to measure the viscosity of a liquid. Its characteristic is that the rotational speed and temperature can be automatically adjusted by an electronic controller, so as to realize automatic measurement and recording. It adopts the principle of rotary measurement, that is, the liquid is placed on a rotating disk, and the viscosity of the liquid is calculated by measuring the resistance of the disk when it rotates. Program-controlled rotational viscometers are widely used in chemical, pharmaceutical, food, plastic and other industries, and can be used for viscosity measurement in quality control, R&D and production processes.

This report studies the global Program-Controlled Rotational Viscometer production, demand, key manufacturers, and key regions.
