Abstracts

According to our (Global Info Research) latest study, the global Propan-1-ol market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Propan-1-ol (also propanol, n-propyl alcohol) is a primary alcohol with the formula $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ and sometimes represented as PrOH or n-PrOH . It is a colourless liquid and an isomer of 2-propanol. It is formed naturally in small amounts during many fermentation processes and used as a solvent in the pharmaceutical industry, mainly for resins and cellulose esters, and, sometimes, as a disinfecting agent.

Propan-1-ol is a chemical product with a wide range of uses. In China, n-propanol is mainly used to produce n-propyl acetate, and the demand in this field accounts for about 65%. N-propyl acetate is widely used in food packaging production and as a printing ink solvent for food packaging. N-propyl acetate is also an important component of lithium battery electrolyte for new energy vehicles. The role of n-propanol as a solvent has not yet been developed on a large scale in China, and the proportion of direct use as a solvent is only about 15%, while the demand for direct use of n-propanol as a solvent in the United States is relatively high. In recent years, driven by the development of downstream coatings, spray paints, inks, adhesives and other industries, as well as the tightening of national environmental protection policies, the consumption of low-toxic n-propanol has continued to grow.

In terms of production process, n-propanol currently mainly has three production methods: ethylene oxo synthesis method, allyl alcohol hydrogenation method and isopropanol recovery method. The three production technologies have their own advantages and disadvantages. The ethylene oxo synthesis method is

currently the most advanced production technology for producing n-propanol in the world, and it is also the current mainstream production technology in the world. The other two methods are actually by-products from other main products. It produces n-propanol, so the production capacity is small, and it is not suitable for large-scale industrialization.
