Abstracts

The global Propeller Shaft Earthing System market size is expected to reach \$ 104 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

Propeller Shaft Earthing System is a marine shaft grounding device used to create a stable, low-resistance electrical connection between the rotating propeller shaft and the vessel hull. It usually consists of a slip ring, silver-graphite or high-conductivity carbon brushes, brush holders, grounding cables, and sometimes a shaft potential monitoring unit. Its main function is to discharge stray electrical currents from the propeller shaft, reduce spark erosion, support cathodic protection performance, and protect the propeller, shaft bearings, gearbox, stern tube and other propulsion components from corrosion or electrical damage.

Demand for Propeller Shaft Earthing Systems is driven by the wider use of impressed current cathodic protection, larger and more electrically complex vessels, stricter vessel maintenance requirements, and shipowners' growing focus on reducing shaft bearing failure, propeller corrosion and unplanned dry-docking costs. Business opportunities mainly come from newbuild vessels, retrofit projects for aging fleets, replacement of brushes and slip rings, and upgrades from basic grounding kits to monitored shaft earthing systems. The market is relatively niche but stable, with opportunities for suppliers that can provide customized shaft-diameter solutions, durable silver-based contact materials, easy maintenance design, and integration with corrosion monitoring or vessel condition-monitoring systems.
