## Abstracts

Propeller Shaft Grounding Systems are electrical grounding systems used in maritime vessels to prevent or mitigate damage caused by stray electrical currents. These systems typically consist of one or more grounding brushes or grounding rings installed around the propeller shaft within the ship's hull. When the ship is in operation, these brushes or rings make electrical contact with the rotating propeller shaft, providing a low-resistance path for stray electrical currents to dissipate harmlessly into the surrounding seawater. By effectively grounding the propeller shaft, these systems help prevent corrosion and damage to vital components such as bearings and seals, as well as reducing the risk of electrical interference with sensitive onboard electronics and communication systems.

According to our (Global Info Research) latest study, the global Propellor Shaft Grounding Systems market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
