According to our (Global Info Research) latest study, the global Prostatic Stent market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Prostate stents are medical devices used to keep open the space surrounding prostatic urethra and bladder neck in order to allow smooth urine flow in case of urine incontinence. These stents are effective in alleviating the bladder outlet obstruction resulted from benign prostatic hyperplasia (common among men aged above 70 years). However, a prostate stent should not be positioned too proximal to the external sphincter because it could cause urine incontinence. Other complications caused by prostate stents include risk of formation of bladder stones and granulation tissues. Additional formation of tissue surrounding the stent could obstruct the normal urine flow.
