Protein gypsum retarder? is an additive commonly used in making gypsum products. Its main component is protein. Protein has a good retarding effect and can adsorb gypsum mineral particles in the water on its surface before coagulation to form a gel, thereby effectively controlling the coagulation speed and viscosity of gypsum and improving the quality of gypsum products.

Protein retarders are a new type of gypsum retarder, which is crucial to improving the production efficiency and quality of gypsum products. The raw materials of protein retarders are mainly derived from natural compounds. The raw materials are widely available, non-toxic and harmless, and environmentally friendly. They are in line with the global green building certification and circular economy trends, and will further promote the demand for replacement of protein retarders. In recent years, with the construction industry's pursuit of environmental protection and high-performance materials, the process of protein retarders has gradually matured, the performance has been continuously optimized, and the production cost has gradually decreased. It has gradually become the new favorite of retarders, and its future development prospects are broad. In the future, new material enhancements and intelligent construction

technologies will further expand their application scenarios. Enterprises need to seize the opportunities of green transformation, strengthen technological research and development and industrial chain integration to cope with global competition and sustainable development needs.
