## Abstracts

According to our (Global Info Research) latest study, the global Protoporphyrinogen Oxidase Inhibitor market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The market prospect of Protoporphyrinogen Oxidase Inhibitor (PPO) is expected to grow at a moderate rate due to factors such as the increasing demand for high-quality food, rising agricultural practices, and the need to improve crop productivity. PPO inhibitors are widely used in crops such as soybean, cotton, peanuts, and wheat, among others, to control herbicide-resistant weeds. The increasing adoption of genetically modified crops that are resistant to PPO inhibitor herbicides is also expected to drive the market's growth. However, the market growth may be restrained by factors such as stringent regulatory policies and the development of alternative herbicides that can replace PPO inhibitors. Nevertheless, the increasing demand for efficient weed control and the advantages of PPO herbicides over other herbicides such as low toxicity and high selectivity are expected to drive the market's growth in the coming years.

The Protoporphyrinogen oxidase (PPO) inhibitor is a group of herbicides that work by inhibiting the enzyme PPO, which is involved in the production of chlorophyll. These herbicides are used to control a wide range of broadleaf and grassy weeds in various crops such as cereals, oilseeds, vegetables, and fruits. PPO inhibitors disrupt the normal photosynthetic process in targeted plants, causing tissue death and ultimately killing the plant. They offer effective and selective weed control with low toxicity to humans and animals. Some common PPO inhibitors include saflufenacil, flumioxazin,

and sulfentrazone.
