According to our (Global Info Research) latest study, the global Proximity Sensor Luminous Door Handle market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The proximity sensor luminous door handle is an intelligent door handle solution with a built-in proximity sensor that can sense the presence or approach of nearby objects and trigger the lighting of the LED light accordingly. When the user's hand or other object approaches the door handle, the proximity sensor detects this change and immediately activates the LED light to illuminate the location of the door handle, allowing the user to easily find and open the door handle at night or in low-light environments. The working principle of the proximity sensor luminous door handle is mainly based on the perception ability of the proximity sensor and the lighting function of the LED light. When the user's hand or other object approaches the door handle, the proximity sensor detects this change and generates a corresponding electrical signal. The electrical signal is then transmitted to the control circuit, which activates the LED light after receiving the signal, so that it lights up and illuminates the location of the door handle. When the user leaves the door handle area, the proximity sensor detects this change again and turns off the LED light, thereby achieving the purpose of automatic lighting and energy saving.

Proximity sensor luminous door handles are widely used in smart homes, hotels, office buildings, public transportation facilities and other fields. In smart homes, as part of the smart home system, it improves the intelligence level and convenience of the home; in hotels and office buildings, it improves the overall image and customer experience of the place; in public transportation facilities, it helps to improve the travel safety and
