PRP involves extracting a small amount of blood from the patient, which is then processed to separate the platelets and plasma from other blood components. The resulting platelet-rich plasma is rich in growth factors and is injected into the skin to stimulate collagen production, improve skin texture and tone, and promote tissue regeneration.

PRF is a more advanced version of PRP. Similar to PRP, blood is drawn from the patient, but the processing method is slightly different. Instead of using an anticoagulant to prevent blood clotting, PRF is obtained by centrifuging the blood sample to separate it into layers. The platelet-rich fibrin, which contains a higher concentration of platelets and growth factors compared to PRP, is then used for various cosmetic procedures.
