Abstracts

According to our (Global Info Research) latest study, the global PSMA Imaging Agent for Prostate Cancer market size was valued at US\$ 1821 million in 2025 and is forecast to a readjusted size of US\$ 2915 million by 2032 with a CAGR of 6.9% during review period.

In 2025, the global production of PSMA imaging agent for prostate cancer reached 3.5394 million units, with an average selling price of \$500 per unit. The annual production capacity of PSMA imaging agents for prostate cancer worldwide is approximately 5 million units, with a gross margin of about 30.4%. PSMA imaging agent for prostate cancer is a radiotracer that targets prostate-specific membrane antigen (PSMA) and enables molecular-level imaging of prostate cancer lesions via positron emission tomography (PET). PSMA is highly expressed on the surface of prostate cancer cells. After the imaging agent specifically binds to it, PET/CT or PET/MRI equipment is used to detect radioactive signals, thereby enabling high-sensitivity localization of primary lesions, detection of metastases, and assessment of recurrence. It is currently an important tool in precision diagnosis and treatment of prostate cancer. The upstream of PSMA imaging agents for prostate cancer includes radionuclides (such as gallium-68, fluorine-18, etc.), PSMA-targeting ligands (small molecules/peptides/antibodies), and nanocarriers/chelators, among others. The midstream consists of manufacturers of PSMA imaging agents for prostate cancer, while the downstream is mainly used in nuclear medicine and molecular imaging, precision tumor diagnosis, and radiopharmaceuticals and nuclear medicine.

Currently, the market for PSMA imaging agent for prostate cancer is in a phase of rapid development. As a revolutionary molecular imaging tool, it has been widely integrated

into clinical management pathways for prostate cancer, playing a key role especially in initial staging, detection of biochemical recurrence, and formulation of treatment strategies. With the growing availability of PET/CT and PET/MRI equipment and the continuous emergence of novel PSMA ligands, the clinical applications of this imaging agent are steadily expanding. Meanwhile, the rise of the theranostics concept means that PSMA imaging agents for prostate cancer are not only used for diagnosis but are also beginning to be linked with PSMA-targeted radionuclide therapy, ushering prostate cancer into a new era of precision medicine. Furthermore, improvements in regulatory approval and standardized production requirements for radiopharmaceuticals, along with gradual optimization of reimbursement policies, have further contributed to the maturation and growth of this market.
