Abstracts

According to our (Global Info Research) latest study, the global PSMA-Targeted PET Imaging Agent market size was valued at US\$ 1821 million in 2025 and is forecast to a readjusted size of US\$ 2915 million by 2032 with a CAGR of 6.9% during review period.

In 2025, the global production of PSMA-targeted PET imaging agents reached 3,539,400 vials, with an average selling price of US\$500 per vial. The global annual production capacity of PSMA-targeted PET imaging agents was approximately 5 million vials, and the gross margin was about 30.4%. A PSMA-targeted PET imaging agent is a radiopharmaceutical that utilizes prostate-specific membrane antigen (PSMA) as a molecular target and is imaged via positron emission tomography (PET). Its core structure consists of two components: a targeting ligand (such as PSMA-11, PSMA-617, PSMA-1007, or other small molecules or peptides) that specifically recognizes and binds to PSMA protein, and a positron-emitting radionuclide (such as ^{68}Ga , ^{18}F , etc.) attached to the ligand. After injection into the human body, the imaging agent selectively accumulates in prostate cancer lesions and metastatic sites, and PET scanning generates three-dimensional images with high sensitivity and high resolution to reveal tumor distribution. It is mainly used for initial staging of prostate cancer, localization of lesions after biochemical recurrence, and guidance for individualized treatment decisions. The upstream of PSMA-targeted PET imaging agents includes radionuclides (e.g., gallium-68, fluorine-18), PSMA-targeting ligands (small molecules, peptides, or antibodies), and nanocarriers/chelating agents. The midstream consists of manufacturers of PSMA-targeted PET imaging agents, and the downstream is primarily applied in nuclear medicine and molecular imaging, precision diagnosis of tumors, and radiopharmaceuticals and nuclear medicine.

Currently, the market for PSMA-targeted PET imaging agents is experiencing sustained growth, driven fundamentally by the rising demand for precision medicine in prostate cancer and the deepening integration of molecular imaging with radiopharmaceutical technologies. Owing to their high affinity and specificity for the PSMA target, these imaging agents have gradually expanded their clinical utility from mainly detecting lesions in patients with biochemical recurrence to broader applications across the entire prostate cancer care continuum, including initial staging, treatment response assessment, and active surveillance, with their clinical acceptance and guideline recommendations notably strengthened. However, large-scale market development still faces challenges such as cold-chain logistics and just-in-time delivery pressures imposed by short radionuclide half-lives, variations in multi-site production quality control standards, and disparities across countries in regulatory approval, reimbursement policies, and radiation safety regulations. Meanwhile, technological advances are focusing on novel ligand design, expansion of radionuclide options (e.g., the shift from ^{67}Ga to ^{18}F), and integrated development under the theranostics concept. These innovations are not only broadening the indications but also shifting the competitive landscape from product-centric rivalry toward platform-based and comprehensive service capabilities. Overall, the industry is moving steadily toward greater precision, standardization, and accessibility.
