Abstracts

The global PTA High Pressure Balloon Catheter market size is expected to reach \$ 5587 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

In 2025, global output of PTA high pressure balloon catheters reaches 18,500,000 units, with an average selling price of 210 USD per unit, total capacity of 22,000,000 units, and a gross margin of 62%.

A PTA high pressure balloon catheter is an interventional medical device used in percutaneous transluminal angioplasty (PTA). By inflating a balloon at high pressure within a stenotic or occluded vessel, it compresses atherosclerotic plaque, enlarges the vessel lumen, and restores blood flow. These products are characterized by high rated burst pressure, controlled compliance, and precise dimensional consistency, and are primarily used in the treatment of peripheral arterial disease and other vascular interventions.

Upstream mainly includes medical-grade polymer materials (such as nylon, PET, and PEBA), metal hypotubes, radiopaque marker materials, coating materials, and precision extrusion and forming equipment. The midstream consists of manufacturers responsible for the design, production, assembly, and sterilization of PTA high pressure balloon catheters, with core capabilities focused on balloon forming technology, pressure performance control, and product consistency. Downstream applications are concentrated in hospital cardiovascular and peripheral vascular interventional departments, with procurement typically conducted through centralized hospital tenders or interventional device distribution channels.
