Pterygium is a common ocular surface lesion that begins in the limbal conjunctiva within the palpebral fissure and progresses to the cornea. It is named after the Greek word pterygos, which means 'wing'. The lesion occurs more frequently at the nasal limbus than the temporal with a characteristic wing-like appearance. UV exposure is strongly linked to the occurrence of pterygia. Individuals having a history of elevated UV exposure and those living closer to the equator have a higher incidence (outdoor work). According to certain research, males have a somewhat higher incidence than females, which could simply be due to a higher rate of UV exposure.
