PTFE medical coated guidewires are used to guide catheters to designated anatomical locations in the vascular system during diagnostic or interventional procedures, and are essential instruments for interventional diagnosis and treatment. The backbone components of medical coated guidewires can be divided into stainless steel core guidewires, nickel-titanium alloy core guidewires, and composite alloy core guidewires, etc. The lubricant or super-slip coating is applied to the surface of the guidewire to improve the lubricity of the guidewire and reduce the friction during operation. The main lubricants applied to medical coated guidewires are hydrophilic coating, silicone oil coating and PTFE coating, etc. Today medical PTFE is the preferred fluoropolymer for many medical device coating applications.
