Abstracts

PTFE membrane filter material is made by a special process and different filter material base cloth——add a layer of polytetrafluoroethylene (PTFE) film on the surface of ordinary filter material, giving the filter over 3-year service span. This film acts as a 'primary dust layer', and the material exchange is performed on the surface of the film, which can be effectively filtered at the beginning of use. The unique three-dimensional network structure of the film prevents dust from passing through, and there is no need to worry about clogging of the pores. This filtering method is called 'surface filtering'.
