According to our (Global Info Research) latest study, the global Public Toilet Information Display System market size was valued at US$ 139 million in 2025 and is forecast to a readjusted size of US$ 273 million by 2032 with a CAGR of 10.3% during review period.

A public toilet information display system is a digital information dissemination platform for the management and service of public toilets. It displays real-time information such as toilet usage status, hygiene conditions, cleaning progress, environmental indicators (e.g., odor, humidity), toilet stall occupancy, and map navigation through electronic screens, smart terminals, or cloud platforms. This system is typically linked with IoT sensors, monitoring equipment, and a management backend to achieve visualized presentation and intelligent management of public toilet operations, thereby improving the user experience for citizens, increasing the efficiency of urban public services, and supporting data-driven decision-making by the government in refined urban governance.

The market demand for public toilet information display systems continues to grow against the backdrop of smart city construction. As various regions promote digital government and refined urban management, the intelligentization of public health facilities has become an important component of government investment. Public toilets, as a direct reflection of urban civilization and resident satisfaction, are increasingly being incorporated into urban governance assessment systems. Therefore, local governments are accelerating the procurement of intelligent display systems that include real-time toilet stall display, environmental monitoring, cleaning supervision, and emergency alarms to improve the quality of public services. Compared to traditional paper signs or manual inspections, intelligent display systems can significantly reduce

management costs, improve the transparency of hygiene standards, and are more in line with modern urban management trends.

From an industry perspective, this market will develop towards standardization, integration, and data services in the future. With the decline in the cost of IoT sensors, the popularization of AI algorithms, and the improvement of cloud platform construction, public toilet information display systems are upgrading from simple information screens to "digital management terminals for public health," capable of predictive cleaning, passenger flow analysis, operation and maintenance early warning, and coordinated dispatch. Continued government investment in digital public services, the development of new urbanization, and the increasing demand for high-standard toilet management in large scenic spots, transportation hubs, and commercial complexes will jointly drive the industry to maintain steady growth. In the future, system compatibility, data interconnectivity, and operational service models will become key factors in market competition.
