Abstracts

The global Public Transport Insurance market size is expected to reach \$ 12769 million by 2032, rising at a market growth of 6.7% CAGR during the forecast period (2026-2032).

Public Transport Insurance refers to risk protection products offered to passengers, operators, or assets using or operating public transport systems (such as buses, subways, intercity trains, ferries, etc.). It includes various insurance liabilities such as accident liability insurance, passenger accident insurance, third-party liability insurance, and operator liability insurance, aiming to reduce economic losses, share compensation liability, and improve the risk resilience of public transport systems in the event of accidents, injuries, or property damage. These products provide passengers with compensation for injury and medical expenses caused by accidents, and also provide operators with protection against third-party compensation and vehicle/facilities damage arising from traffic accidents, contributing to improved urban transportation safety and reliability. The global gross margin for Public Transport Insurance is projected to be approximately 15%-30% in 2025.

With rapid global urbanization and the continuous expansion of public transport systems, the market demand for public transport insurance continues to grow. The increased operational scale of urban rail transit, bus systems, and ferry services significantly increases accident risk exposure, while increasingly stringent regulatory compliance requirements drive operators to adopt comprehensive risk protection measures to reduce legal and compensation costs. Furthermore, the widespread adoption of new electric buses and intelligent connected vehicles has created demand for insurance products with new risk types, such as technical failure liability insurance and cybersecurity liability insurance, thus providing opportunities for innovative product

development. Market digitalization and the application of insurtech have also improved the accuracy of product pricing and risk control, helping insurance companies expand market coverage and improve service efficiency. Despite significant demand growth, the public transport insurance market faces severe profitability pressure and high payout risks. On the one hand, high accident payouts and complex risk assessments require insurance companies to rely on actuarial models and extensive data support to avoid losses; on the other hand, cross-border operations and different regulatory frameworks increase underwriting difficulties. Economic cyclical fluctuations, inflation, and rising payout costs also pose challenges to insurance product pricing and actuarial profitability. In addition, insufficient insurance awareness among operators and passengers, especially in some developing countries, limits product penetration. Continuous technological risks (such as autonomous driving system failures) and climate risks (such as accidents caused by heavy rain) are also potential loss factors that cannot be ignored in the market. The increasing emphasis on safety and passenger experience in public transportation places higher demands on passenger accident insurance and overall liability protection for operators. This is driving insurance companies to develop combined insurance solutions that integrate multiple functions, including accident coverage, legal liability, and operational interruption compensation. Meanwhile, with the development of shared mobility and on-demand transportation models, flexible, low-cost insurance products (such as short-term passenger insurance and per-trip insurance) are becoming increasingly popular. Insurance companies are collaborating with transportation operators and city management authorities to launch customized risk management solutions, providing refined protection services for different operating models, which helps enhance product attractiveness and market penetration.
