## Abstracts

According to our (Global Info Research) latest study, the global Pulp Molding for Medical Packaging market size was valued at US\$ 370 million in 2025 and is forecast to a readjusted size of US\$ 614 million by 2032 with a CAGR of 7.6% during review period.

Pulp molding for medical packaging refers to medical-grade packaging products manufactured from natural fiber materials such as wood pulp, recycled paper pulp, sugarcane bagasse pulp, and bamboo pulp through pulp molding processes. These products are widely used for medical devices, disposable consumables, pharmaceutical trays, surgical instrument inserts, and sterile transportation packaging. Molded pulp medical packaging features biodegradability, recyclability, cushioning performance, compressive strength, and compliance with environmental regulations, making it an important sustainable alternative to conventional plastic foam and thermoformed plastic packaging. With the increasing emphasis on ESG and sustainable healthcare supply chains worldwide, molded pulp medical packaging is rapidly penetrating hospitals, IVD applications, pharmaceutical packaging, and medical device logistics. The pulp molding industry chain for medical packaging mainly comprises three core segments: upstream raw materials, midstream manufacturing and processing, and downstream medical applications. Upstream primarily involves suppliers of fiber raw materials such as wood pulp, recycled pulp, bagasse pulp, and bamboo pulp, as well as suppliers of molds, molding equipment, and additives. In recent years, due to increasingly stringent environmental requirements, more and more companies are adopting renewable plant fibers and food-grade environmentally friendly additives to meet the medical industry's requirements for safety and sustainability. The midstream segment is the pulp molding production and manufacturing process, including pulping, compression molding, hot

pressing, edge trimming, sterilization and compatibility treatment, and cleanroom packaging. Compared to ordinary pulp molding, medical packaging has higher requirements for cleanrooms, dimensional accuracy, antibacterial properties, and ISO 13485 medical system certification, thus resulting in relatively high barriers to entry. Downstream applications mainly include medical device packaging, IVD diagnostic product trays, pharmaceutical transport packaging, surgical instrument cushioning packaging, and disposable medical consumable packaging. With the growth of global medical device exports and the advancement of green supply chain policies, more and more medical companies are adopting biodegradable pulp molded packaging to replace traditional EPS foam and PET blister packaging, driving the entire industry chain towards high-end, environmentally friendly, and customized development.
