According to our (Global Info Research) latest study, the global Pulse Isolator market size was valued at US\$ 4573 million in 2025 and is forecast to a readjusted size of US\$ 8023 million by 2032 with a CAGR of 8.5% during review period.

A pulse isolator is a device with inputs and outputs that converts and distributes pulse signals. It internally shapes the pulse signal received from the device connected to the input side.

The pulse isolator is a device that outputs the wave-formed pulse signal to the device connected to the output side. Since the input and output sides are isolated inside the pulse isolator, it can be used without problems even when the potential of the input side differs from that of the output side. Noise and other effects generated on the input side are not transmitted to the output side. When inputting measurement results from industrial equipment or measuring instruments to another device for data processing, direct input is not possible if the signal level, duty, etc. are different. In this case, a pulse isolator is a device that matches the signal specifications and passes the signal between devices.

The pulse isolator also functions as a signal distributor when inputting measured data to multiple devices.
