Abstracts

According to our (Global Info Research) latest study, the global Pulse Modulation TOF Camera market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A pulse modulated TOF (Time-of-Flight) camera is a camera that performs depth measurement based on the time-of-flight principle. It continuously emits light pulses (usually invisible light) to the target object and receives the light pulses reflected from the object. It calculates the distance between the measured object and the camera by detecting the flight (round-trip) time of the light pulses. In a pulse modulated TOF camera, pulse modulation is a key modulation method that directly measures the distance based on the time difference between pulse emission and reception.

The pulse modulated TOF camera generates three-dimensional image data by emitting an infrared light source to the object being measured and measuring the time difference between the emission and the reflection of the light wave to determine the distance. This technology has obvious advantages in terms of long distance, low cost, small size, and fast response time. Pulse modulated TOF cameras have been widely used in consumer electronics, robotics, industrial automation, logistics, security monitoring and other fields. In the field of consumer electronics, TOF cameras are used in scenarios such as face recognition, somatosensory games, and gesture control; in the field of robotics, they are used for automatic obstacle avoidance and intelligent navigation; in the field of industrial automation, they are used for cargo identification and logistics package volume measurement. In summary, the pulse modulated TOF camera market is in a rapid development stage, and in the future, the pulse modulated TOF camera market will usher in a broader development space.
