Abstracts

Pultrusion is a manufacturing process used for making parts with a constant cross-section. Pultrusion can also be carried out using thermoplastic as the matrix material. Pultrusion can manufacture composite products with a high fiber ratio where materials are pulled through the die. The use of pre-formers closely control the resin: fiber ratio and fiber rovings (sometimes together with fabrics) are pulled from the rear of the machine. When the resin hardens from the heated steel pultrusion die, the final product is one that follows the shape of the die and is strong and lightweight. As it is formed continuously after being heated by high temperature and then cured, it has excellent anti-corrosion, insulation and economic benefits.

This report studies the global Pultruded Profiles production, demand, key manufacturers, and key regions.
