## Abstracts

The global Pump Wear Ring market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A pump wear ring is a component used in centrifugal pumps to reduce the wear and tear on the impeller and casing. It is typically made of a softer material than the impeller and casing, such as bronze or stainless steel, and is installed between the impeller and casing. The wear ring creates a small gap between the impeller and casing, allowing for smooth rotation of the impeller without direct contact with the casing. This helps to minimize friction and wear, prolonging the life of the pump and improving its efficiency.

This report studies the global Pump Wear Ring production, demand, key manufacturers, and key regions.
