## Abstracts

According to our latest research, the global Pumped Two-Phase Cooling System market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

A two-phase cooling system is an advanced thermal management solution designed to efficiently dissipate heat from electronic components and systems through the phase change of a working fluid. This system operates by immersing components in a dielectric fluid, which has the capability to absorb heat. As the fluid heats up, it evaporates into vapor, effectively transporting heat away from the source. The vapor then rises to a condenser, where it cools and condenses back into liquid form, releasing the absorbed heat. This cycle allows for high heat transfer coefficients, significantly improving thermal performance compared to traditional cooling methods.
