Abstracts

The global PV Panel Cleaning Robot market size is expected to reach \$ 914 million by 2032, rising at a market growth of 12.0% CAGR during the forecast period (2026-2032).

PV Panel Cleaning Robot is an automated cleaning device designed for solar panel operation and maintenance, using mobile drive systems, brush cleaning or dry-cleaning modules, sensing control, and battery power to remove dust, sand, bird droppings, and other surface deposits from photovoltaic modules. Compared with a narrowly defined mobile cleaning robot for PV, this product definition emphasizes broader solar panel cleaning scenarios, including utility-scale ground-mounted plants, distributed rooftop systems, industrial and commercial rooftops, and high-dust regions where cleaning frequency directly affects power generation efficiency. In 2025, production was approximately 80,000 units and the average price was USD 5,000 per unit. The industry's capacity utilization rate in 2025 was about 70% and the average gross margin was around 30%. Upstream, the key inputs include brushless motors, lithium batteries, sensors, and controllers, with representative suppliers such as Nidec, CATL, and Bosch providing drive motors, battery systems, sensing components, and control modules. The midstream segment focuses on robot structural design, panel walking mechanism development, cleaning module integration, battery endurance optimization, obstacle detection, route planning, dust and sand adaptability, waterproof and weather-resistant design, remote monitoring, safety testing, and automated assembly, which together determine cleaning efficiency, operating stability, panel compatibility, service life, and cost competitiveness. Downstream, Solar Panel Cleaning Robot is mainly used in ground-mounted photovoltaic power stations and rooftop photovoltaic systems, with representative photovoltaic power generation companies including China Three Gorges Renewables, Enel Green Power, and NextEra Energy.

PV Panel Cleaning Robot demand will be shaped by the growing sensitivity of photovoltaic operators to power losses caused by dust, sand, bird droppings, and uneven soiling. In large ground-mounted plants, especially in desert and arid regions, automated cleaning helps reduce labor exposure, water use, and generation loss from delayed maintenance. Rooftop systems add another application logic because access is limited and manual cleaning is less efficient. Customers will increasingly compare robots by cleaning consistency, panel compatibility, battery endurance, obstacle avoidance, weather resistance, remote monitoring, maintenance cost, and the ability to operate safely across different installation layouts.
