Abstracts

The global PV Recycling market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

With the rapid development of photovoltaic power generation, the recycling and reuse of waste photovoltaic modules has also emerged. The mainstream technologies for recycling waste photovoltaic modules can be divided into three categories: heat treatment, physical and chemical methods. The heat treatment method refers to the method of softening, peeling or decomposing the organic encapsulation layer EVA by heating to achieve the purpose of separating the cover glass and the solar cell; the physical method refers to relying on mechanical means such as physical cutting, hammering, extrusion and grinding. , to separate and decompose each material of the component to form powder; the chemical method is to use organic or inorganic acid and other chemical reagents to dissolve or swell EVA, which has achieved the purpose of separating glass, backplane, battery, etc.
