Abstracts

The global PVC Feeding Tube market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

PVC Feeding Tubes is a feeding tube made of PVC material. The feeding tube is used in special cases to help patients who cannot swallow to deliver the necessary water and food. The length of the oral-gastric tube is about 45cm, which can be inserted orally by 35~40cm. The length of the nasogastric tube is about 105cm, which needs to be inserted about 55cm through the nostrils, through the pharynx and through the esophagus to the stomach. The nasogastric tube is easy to slip out, which should be firmly pasted to prevent repeated intubation and aspiration. The tube is composed of the tube, the gastroenteric tube injection joint, the gastric tube clip and the cross blocking cap. With the indwelling nasogastric tube placed in the esophagus, the original physiological environment of the digestive tract of the patient is changed, which will lead to the lax closure of the end of the esophageal sphincter, airway obstruction, and other pressure stimulation such as severe cough, which may easily lead to esophageal reflux and other complications. Gastric fluid can also be extracted through the gastric tube.
