Dual Layer Access Pipe is a kind of pipe formed by the close combination of two inner and outer layers of pipes. The inner layer is the conveying pipe, which is responsible for conveying fluids or gases. The outer layer is a protective sleeve, providing additional protection and support. The annular gap between the inner and outer pipes is usually filled with thermal insulation materials to maintain the temperature of the conveyed medium and provide insulation effect. This design can provide dual protection, making the pipeline safer and more reliable when transporting fluids or gases, while effectively preventing leakage and environmental pollution.
