According to our latest research, the global PVD Sputtering Coating Equipment market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

PVD Sputtering Coating Equipment is an advanced surface treatment equipment. Its core is to use the sputtering effect to transfer target atoms to the surface of the substrate to form a high-quality, uniform and dense film layer. The phenomenon that atoms on the surface of the target are knocked out and scattered. In the sputtering process, an inert gas (such as argon) is first introduced into the vacuum chamber and ionized by an electric field to form a plasma. The high-energy ions in the plasma hit the surface of the target under the acceleration of the electric field, causing the target atoms to be sputtered out. These sputtered atoms are then deposited on the substrate to form the desired film.
