Silicon carbide (SiC) is the third generation compound semiconductor material. Chip is the cornerstone of the semiconductor industry. According to the historical process, the core materials for making chips are divided into the first generation of semiconductor materials (most of which are high-purity silicon widely used at present), the second generation of compound semiconductor materials (gallium arsenide and indium phosphide), and the third generation of compound semiconductor materials (silicon carbide and gallium nitride). Silicon carbide will be the most widely used basic material for making semiconductor chips in the future because of its superior physical properties: high band gap (corresponding to high breakdown electric field and high power density), high conductivity and high thermal conductivity.
