According to our (Global Info Research) latest study, the global Pyrgeometer market size was valued at US\$ 25.2 million in 2024 and is forecast to a readjusted size of USD 31.8 million by 2031 with a CAGR of 3.4% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A pyrgeometer is a device that measures near-surface infra-red (IR) radiation, approximately from 4.5 μ m to 100 μ m on the electromagnetic spectrum (thereby excluding solar radiation). It measures the resistance/voltage changes in a material that is sensitive to the net energy transfer by radiation that occurs between itself and its surroundings (which can be either in or out). By also measuring its own temperature and making some assumptions about the nature of its surroundings it can infer a temperature of the local atmosphere with which it is exchanging radiation. Since the mean free path of IR radiation in the atmosphere is ~25 meters, this device typically measures IR flux in the nearest 25 meter layer.
