Abstracts

The global Pyridine-d5 market size is expected to reach $ 49.54 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

In 2025, global sales volume of Pyridine-d5 was approximately 2.5 metric tons, with an average ex-factory selling price of about US$12,500 per kilogram. Gross margins of major manufacturers were approximately 40%–55%.

Pyridine-d5 (CAS 7291-22-7) is a stable isotope-labeled compound in which all five hydrogen atoms on the pyridine ring are replaced by deuterium. It has a molecular formula of C?D?N and a molecular weight of approximately 84.13. The product is typically a colorless to pale yellow liquid and retains the basicity, solvency, and coordination properties of pyridine while significantly reducing interference from ordinary hydrogen atoms in ?H nuclear magnetic resonance spectroscopy. It is primarily used as a deuterated solvent for NMR analysis and is particularly suitable for acidic compounds, aromatic compounds, triterpenoid saponins, and other samples with limited solubility in conventional deuterated solvents. Key performance indicators include deuterium enrichment, chemical purity, water content, residual proton signal, and storage stability. Commercial products generally have a deuterium enrichment of at least 99.5% D.

The upstream supply chain of Pyridine-d5 mainly comprises high-purity pyridine, heavy water or other deuterium sources, exchange-reaction catalysts, and materials used for distillation, drying, and inert-atmosphere packaging. Downstream demand is centered on nuclear magnetic resonance analysis and extends to organic synthesis, drug development, materials research, and stable isotope labeling. Due to the strong hygroscopicity of pyridine, Pyridine-d5 is typically supplied in sealed bottles or ampoules. Water content and residual non-deuterated pyridine must be tightly

controlled to ensure NMR spectral quality and batch-to-batch consistency.
