Abstracts

Pyrolysis gasoline, also known as pygas, is a byproduct of various thermal cracking processes used in the petroleum refining industry to convert heavier hydrocarbons into lighter ones, such as naphtha, gasoline, and olefins. Pyrolysis gasoline contains a mixture of hydrocarbons, including unsaturated compounds like olefins and diolefins, as well as aromatic compounds.

Hydrogenation of pyrolysis gasoline is a process aimed at saturating these unsaturated compounds to improve the quality of the gasoline and increase its stability, octane rating, and suitability for downstream processing. This hydrogenation process typically involves the use of catalysts to facilitate the reaction under milder conditions.

According to our (Global Info Research) latest study, the global Pyrolysis Gasoline Hydrogenation Catalysts market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
