The global qPCR Probes market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Probe-based qPCR is a PCR method that uses fluorescently labelled sequence specific DNA oligonucleotides, known as probes, to get very accurate and specific results. Using probes requires first not just designing primers, but also probes, which may make the experiment more time-consuming and expensive than using dye-based qPCR option, but at the same time also allows multiplexing to win back the lost time.
