A quadrupedal wheeled-legged robot is a type of robot equipped with four legs, each incorporating wheels. By mimicking quadrupeds, it not only combines the agility of legged movement, capable of bending, stretching, and other motions, but also possesses the advantages of wheeled locomotion, offering strong stability and the capability to move at high speeds on flat surfaces. The legs of this robot typically feature multiple degrees of freedom and precise motion control, enabling it to coordinate the movements of its four legs and the rolling of its wheels to adapt to various terrains and mission requirements.
