According to our (Global Info Research) latest study, the global Quantitative Brain Function Imaging Device market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The quantitative brain function imaging device is a product that detects changes in the concentration of hemoglobin in the cerebral cortex. It utilizes the good penetration effect of near-infrared light on organisms, and emits near-infrared light through the optical fiber probe to penetrate the cerebral cortex and reflect back to the receiving probe. While the amount of absorption changes, the detection of changes in local blood oxygen concentration is considered to be an indirect measurement of the neural activity of the cerebral cortex. It realizes the simultaneous detection of multiple channels in different brain regions and achieves the purpose of studying advanced brain functions; it is painless and painless. Traumatic, real-time, continuous features.
