The global Quantitative Brain Function Imaging Device market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The quantitative brain function imaging device is a product that detects changes in the concentration of hemoglobin in the cerebral cortex. It utilizes the good penetration effect of near-infrared light on organisms, and emits near-infrared light through the optical fiber probe to penetrate the cerebral cortex and reflect back to the receiving probe. While the amount of absorption changes, the detection of changes in local blood oxygen concentration is considered to be an indirect measurement of the neural activity of the cerebral cortex. It realizes the simultaneous detection of multiple channels in different brain regions and achieves the purpose of studying advanced brain functions; it is painless and painless. Traumatic, real-time, continuous features.
