## Abstracts

According to our (Global Info Research) latest study, the global Quantum Radar market size was valued at US\$ 429 million in 2025 and is forecast to a readjusted size of US\$ 1307 million by 2032 with a CAGR of 17.9% during review period.

In 2025, global production of quantum radar systems is estimated at approximately 325 units, with an average selling price of about USD 1,280,000 per unit. Quantum radar is an advanced radar system based on quantum entanglement and quantum imaging principles for target detection and identification. Compared with conventional radar, it offers higher target resolution, stronger anti-jamming capability, and potential detection of stealth targets. These systems are typically applied in defense, aerospace monitoring, and advanced scientific research, featuring high security, low detectability, and integratable operations. With the development of quantum technologies and superconducting detectors, quantum radar is gradually transitioning from laboratory research to preliminary application scenarios, laying the technological foundation for future high-precision target detection.

Currently, the quantum radar market remains in the technology R&D and early prototype application stage, with a very limited market size but active technological innovation. Demand is concentrated in defense, aerospace monitoring, and research institutions, with highly specialized application scenarios. Industry trends indicate that quantum radar is evolving toward higher sensitivity, longer detection range, miniaturization, and deployability, while the maturity of core components such as quantum entanglement sources and superconducting detectors is gradually improving. Market perspectives suggest that although short-term commercialization is limited and costs are extremely high, breakthroughs in quantum technologies and steady growth in military and research demand present significant potential for quantum radar in high-

end defense and advanced research markets.
