Abstracts

The global Quinine Dihydrochloride market size is expected to reach \$ 230 million by 2032, rising at a market growth of 3.1% CAGR during the forecast period (2026-2032).

In 2025, global Quinine Dihydrochloride output reached about 300 million dosage units and global capacity of around 360 million dosage units. The average price is about USD 0.60 per dosage unit, with gross margins near 45%. Quinine Dihydrochloride is a highly water-soluble hydrochloride salt of quinine, a natural cinchona alkaloid extracted primarily from the bark of Cinchona trees or produced through pharmaceutical purification processes. It is used as an active pharmaceutical ingredient (API) in injectable and specialty pharmaceutical formulations for the treatment of severe malaria and other specific medical applications where rapid systemic administration is required, as well as in pharmaceutical research and reference standards. The supply chain begins with the cultivation and harvesting of Cinchona bark or the procurement of purified quinine base, followed by alkaloid extraction, purification, and conversion into quinine dihydrochloride through controlled hydrochloric acid neutralization and crystallization. The API then undergoes filtration, drying, milling, quality control testing, and GMP-compliant manufacturing before being supplied to pharmaceutical companies for formulation into injectable solutions or other dosage forms. Finished products are packaged, distributed through pharmaceutical wholesalers and healthcare supply networks, and ultimately delivered to hospitals, clinics, government health agencies, humanitarian organizations, and other medical institutions under stringent regulatory and quality assurance requirements.
